Found 6 (127)

Handwriting practice sheet with dotted lines and musical notes (sharps and flats) for tracing.

Found 7 (127)

[illegible]

Found 8 (61)

Handwriting practice sheet for the character '井' (well).

The character '井' is shown in a dotted format for tracing on a grid of 10 rows and 20 columns.

The character '井' is composed of two main parts: a vertical stroke on the left and a horizontal stroke on the right.

The first row shows the character '井' in a dotted format for tracing.

The second row shows the character '井' in a dotted format for tracing.

The third row shows the character '井' in a dotted format for tracing.

The fourth row shows the character '井' in a dotted format for tracing.

The fifth row shows the character '井' in a dotted format for tracing.

The sixth row shows the character '井' in a dotted format for tracing.

The seventh row shows the character '井' in a dotted format for tracing.

The eighth row shows the character '井' in a dotted format for tracing.

The ninth row shows the character '井' in a dotted format for tracing.

The tenth row shows the character '井' in a dotted format for tracing.

Task 2: Collect Personal Gesture Data

- wanddata_all.json file is linked in the Github Repository

Task 3: Deploy Fine-Tuned int8 Quantized Model

fine-tuned model, there was more variation in the results. While many digits had high confidence scores, some digits (8 and 3 in particular) were classified with lower confidence and less consistency. One possible explanation is related to the data collection process. My lab partner and I split up the gesture recordings. I collected digits 0–7 and she collected digits 8 and 9. When the datasets were combined into a single JSON file, differences in drawing style or possible formatting inconsistencies may have affected the training quality for those digits, especially 8. Since the fine-tuned model relies heavily on the personalized dataset, inconsistencies in the collected data could have caused the change in performance.

- Overall, the baseline model performed better and produced more consistent predictions. This is likely because the original pretrained dataset was larger, more balanced, and contained more diverse samples than our custom fine-tuning dataset. Fine-tuning did not significantly improve performance for our specific gesture style because the collected dataset was relatively small and may not have provided enough high-quality examples for every digit class.
